Interpret DEA results

For FDH the results indicate that every DMU is efficient. This is primarily because the scale is able to assess even the lowest degree of efficiency because there is no geometrical constraint.

#For CRS the findings show that DMUs 1, 2, 3, and 4 are effective. Only 97.75% of DMU(5) and 86.7% of DMU(6) are effectively used. On the basis of our initial analysis, we discovered this. In addition, DMU(4peer)'s units are 1, 2, and 4, with weights of 0.2, 0.08, and 0.54. The peer units for DMU(6) are 1, 2, and 4, with respective weights of 0.34, 0.4, and 0.13. #For VRS the results showed that DMUs 1, 2, 3, 4, and 5 are productive. Only 89.63% of the DMU(6) is effective. On the basis of our initial analysis, we discovered this. Additionally, the peer units for DMU(6) are 1, 2, and 5, with corresponding relative weights of 0.4, 0.34, and 0.26. #For IRS the results showed that DMUs 1, 2, 3, 4, and 5 are effective. Only 89.63% of DMU(6) is effective. Based on our initial study, we discovered this. Additionally, the peer units for DMU(6) are 1, 2, and 5, with respective relative weights of 0.4, 0.34, and 0.26. #For DRS the results showed that DMUs 1, 2, 3, and 4 are effective. Only 97.75% of DMU(5) and 86.7% of DMU(6) are efficient. On the basis of our initial analysis, we discovered this. In addition, DMU(4peer)'s units are 1, 2, and 4, with respective weights of 0.2, 0.08, and 0.54. The peer units for DMU(6) are 1, 2, and 4, with respective weights of 0.34, 0.4, and

0.13. #For FRH all DMUs are efficient, according to the FRH data. This is mainly because there isn't a convexity assumption used, and most of the time, this technique enables the scale to capture even the tiniest amount of efficiency that is not subject to replication or disposal.

plotting for all DEA acceptance of FDH, CRS, VRS, IRS, DRS,and FRH

Plot for Free Disposability Hull(FDH)
